

The CH100V2 Pack is a system for all customer facing environments. This system gives an affordable access solution for clients and visitors with reduced mobility to gain access to premises.

**The system is composed of a call unit and a receiver with ringtone and a flash.**

- The easily recognisable call transmitter can be wall-mounted either by using the included set of screws or on other areas using the adhesive strip.

The call unit is activated when we press the call button, the receiver will emit a sound and a flashing light, indicating that a visitor needs assistance.

- The receiver can be placed at reception, a client service point or at the main entrance of a shop.

The transmitting distance between the two units can reach 30 meters inside and 50 meters in an open area.

● **Product purpose**

Handicapped or elder persons and people with push chairs meet every day physical barriers like heavy doors, doorsteps, steps and other obstacles which keep them from reaching public areas, buildings, restaurants and shops.

By placing a call unit at the entrance of your building, you will offer a unique and appreciated service to all your clients and visitors.
